

Development of a heuristic algorithm to design stand-alone microgrids for rural electrification projects considering distributed generation

Cañizares F., Kirchhoff H., Gomis O., Ranaboldo M.

1. Introduction

- a. Motivation
- b. Input – Output
- c. Considerations

2. Architecture of the algorithm

- a. Phase I: Initial solution construction
- b. Phase II: Distributed generation incorporation
- c. Phase III: Microgrids expansion

3. Results – Case Study

4. Conclusions and future steps

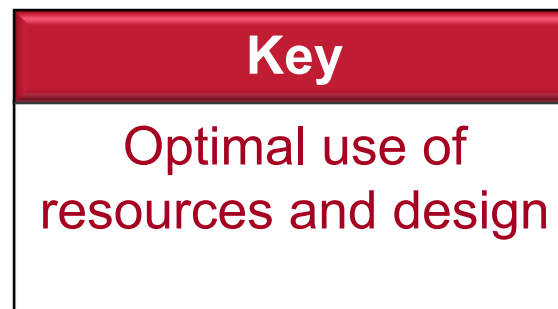

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Motivation

45% of rural areas electrified through mini-grids by 2030 (IEA, 2011)

1. Generation technology
2. Topology of electrical network

Up-front costs of the electrification project

Introduction

1. Introduction

- a. Motivation
- b. Input – Output**
- c. Considerations

2. Architecture of the algorithm

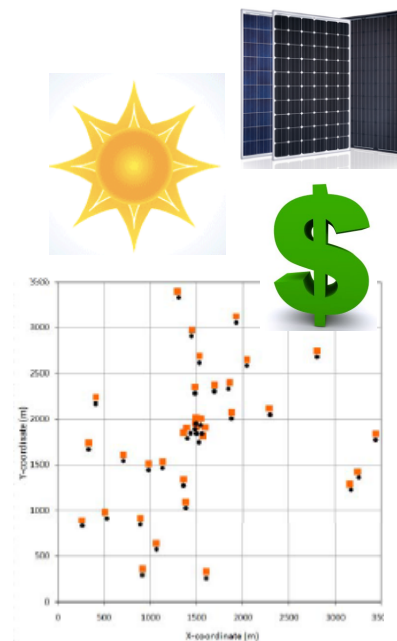

- a. Phase I: Initial solution construction
- b. Phase II: Distributed generation incorporation
- c. Phase III: Microgrids expansion

3. Results – Case Study

4. Conclusions and future steps

Input - Output

- 1) Consumers' location,
- 2) Consumers' power and energy demand,
- 3) Cost and electrical characteristics of potential equipment,
- 4) Electrical constraints.
- 5) Local solar radiation.

1. Introduction

- a. Motivation
- b. Input – Output
- c. **Considerations**

2. Architecture of the algorithm

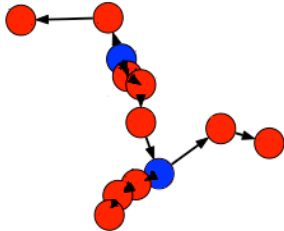

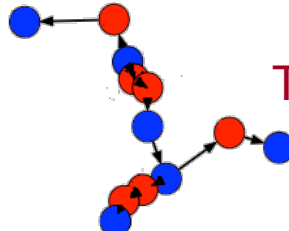

- a. Phase I: Initial solution construction
- b. Phase II: Distributed generation incorporation
- c. Phase III: Microgrids expansion

3. Results – Case Study

4. Conclusions and future steps

Considerations

- AC microgrids, • Generation points located at
- Radial network, consumption points,
- Generation based on RE (Solar)
- Minimization of upfront investment
- All generation points with similar power capacities.

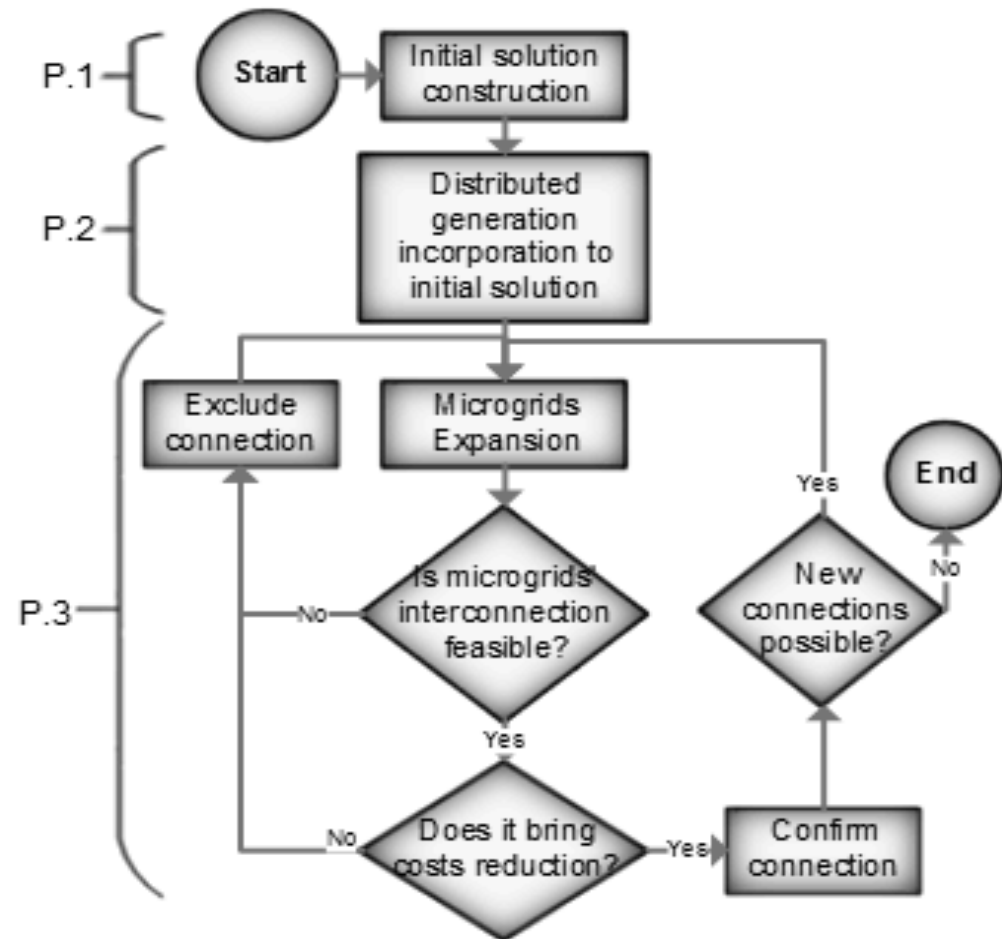

Scenario A	Scenario B
 <p>Total power Req: 1.2 kW</p> <p>Number Generation points: 2 Power capacity per GP \approx 0.6 kW</p>	 <p>Total power Req: 1.2 kW</p> <p>Number Generation points: 6 Power capacity per GP \approx 0.2 kW</p>

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Overview: Main phases

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Phase I: Initial solution construction

Initial point selection

Demand concentration index

$$DI_j = \sum_{j \in N_i} \frac{ED_j}{\max(L_{ij}, L_{min})}$$

(Ranaboldo, 2013)

Electrical network construction

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Phase II: Distributed generation incorporation

$$Cost = \min \left[\sum_{i=1}^n (NG_{Gi} \cdot CostG_{Gi} + NB_{Bi} \cdot CostB_{Bi} + NCC_{CCi} \cdot CostCC_{CCi} + NI_{Ii} \cdot CostI_{Ii} + NC_{Ci} \cdot CostC_{Ci}) \right]$$

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Phase II: Distributed generation incorporation

Selection of cheapest scenarios - Estimation

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Phase II: Distributed generation incorporation

Architecture of the algorithm

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Phase III: Microgrids Expansion

Case A

Cost A < Cost B?

Selection of
final solution

Case B

Results – Case Study

1. Introduction

- a. Motivation
- b. Input – Output
- c. Considerations

2. Architecture of the algorithm

- a. Phase I: Initial solution construction
- b. Phase II: Distributed generation incorporation
- c. Phase III: Microgrids expansion

3. Results – Case Study

4. Conclusions and future steps

Sonzapote (Nicaragua)

Results – Case Study

1. Introduction
a. Motivation
b. Input – Output
c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction
b. Phase II: Distributed generation incorporation
c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

Sonzapote (Nicaragua)

Cost comparison

SHS – Centralized approach – Proposed Algorithm

Reference Scenarios	SHS	Centralized Generation
Cost [USD]	73,221	63,364
Cost of Algorithm [USD]	61,510	
Difference between Algorithm and References	-19%	-3%

Cost comparison

Proposed Algorithm – HOMER Pro

Total real HOMER Pro:	59,431 USD
Total Algorithm:	61,510 USD

Difference: 3.7%

Results – Case Study

1. Introduction
a. Motivation b. Input – Output c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction b. Phase II: Distributed generation incorporation c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

- Gap in the design models/software of off-grid systems considering generation and distribution network.
- Use of design algorithms greatly simplify the design process of the electrification process, while achieving investment reductions.
- Similar investment costs found for centralized and distributed generation solutions.
- Implementation of multiple smaller microgrids rather than a bigger one – *Investment reduction*
- Selection of amount of generation points can be solved from a technical/economical perspective.

Future Steps

1. Introduction
a. Motivation b. Input – Output c. Considerations
2. Architecture of the algorithm
a. Phase I: Initial solution construction b. Phase II: Distributed generation incorporation c. Phase III: Microgrids expansion
3. Results – Case Study
4. Conclusions and future steps

- Inclusion of additional configurations as part of the potential solutions:
 - DC microgrids,
 - SHS,
 - Microgrids with a single generation point.

Goal: Electrification projects exploiting the benefits of each possible configuration

- Optimization of the type of cable used for the electrical network.
- In general, increase the efficiency of the algorithm.

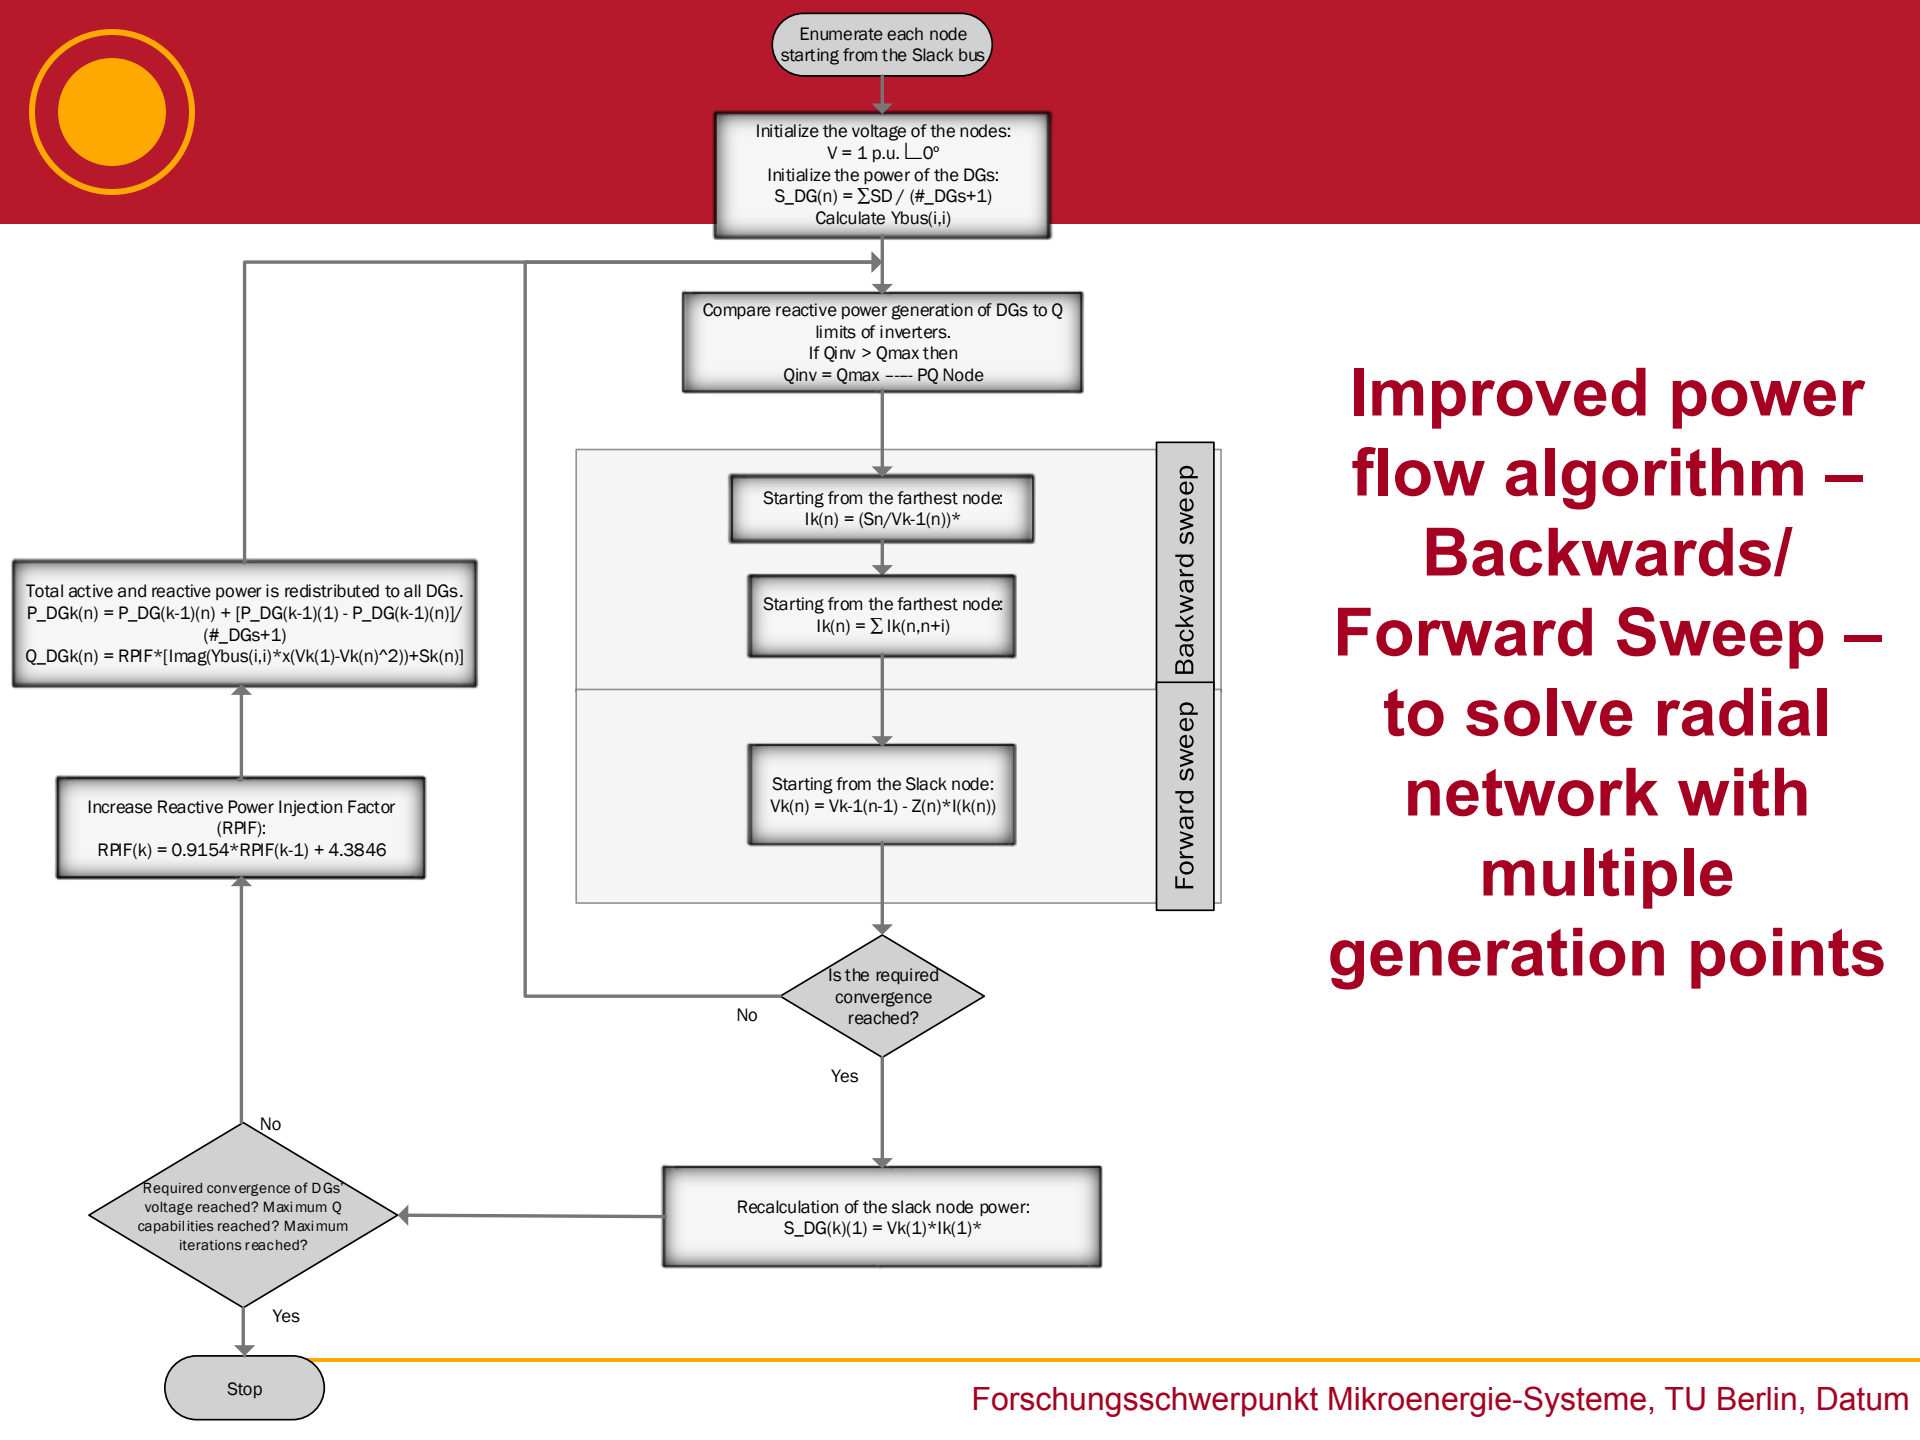

Thanks for your attention!

ESMAP – Voltage drop estimation

U. World Bank, *Mini-Grid Design Manual*, vol. ESMAP
Technical Paper 007. 2000. pp. 228 - 231

$$\%VD \approx 2 \cdot (r \cdot \cos \phi + x \cdot \sin \phi) \cdot \frac{\sum_{n=1}^N L_n \text{ (km)} \cdot P_n \text{ (kW)}}{E^2 \cdot \cos \phi} \cdot 10^5 \%$$

Case Study – Sonzapote (Nicaragua)

- Sonzapote (Nicaragua),
- 345 inhabitants,
- Community composed by households, a school and a church
- Completely un-electrified,
- Demand assessment necessary
- 34 consumption points of the community selected

Case Study – Details of generation system design

Microgrid 1

DG Location	Devices	Type	Amount	Cost [USD]
1	PV Panel	3	8	8016
	Inverter	3	12	1110
	Batteries	1	23	7485
	Charge Controller	2	7	2800
18	PV Panel	3	8	8016
	Inverter	3	12	1110
	Batteries	1	22	7160
	Charge Controller	2	7	2800

Microgrid 2

DG Location	Devices	Type	Amount	Cost [USD]
31	PV Panel	3	4	4008
	Inverter	1	11	506
	Batteries	1	11	3580
	Charge Controller	3	2	1442
28	PV Panel	3	4	4008
	Inverter	1	11	506
	Batteries	1	11	3580
	Charge Controller	3	2	1442

Proposed algorithm– Equipment considered

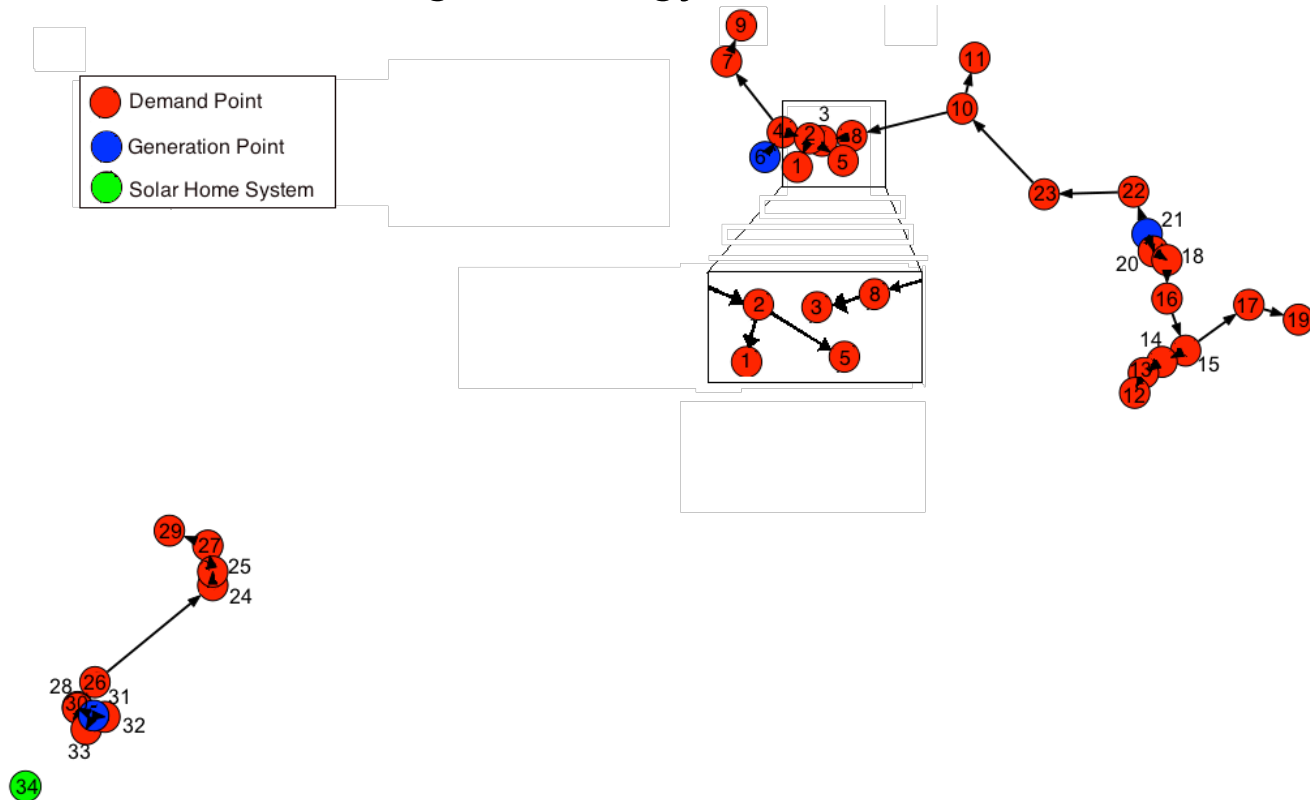

Inverters	Capacity [W]	Cost [USD]
Type 1	200	46
Type 2	300	70
Type 3	400	92.5
Type 4	1500	444
Batteries	Capacity [Wh]	Cost [USD]
Type 1	1290	325.47
Type 2	2520	693.21
PV Modules	Capacity [Wp]	Cost [USD]
Type 1	55	359
Type 2	150	800
Type 3	250	1002
Charge Controllers	Capacity [W]	Cost [USD]
Type 1	72	92.5
Type 2	300	400
Type 3	540	721
Cables	Ampacity [A]	Cost [USD/m]
Type 1	70	3.4
Type 2	100	3.9
Type 3	150	4.5
Type 4	205	5.4

Reference Scenario – Centralized Generation

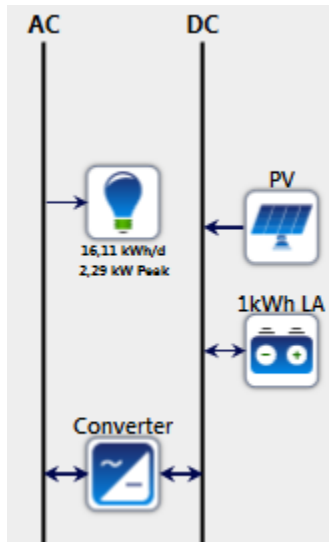

Scenario solved using the model presented in:

Ranaboldo, M., García-Villoria, A., Ferrer-Martí, L., Pastor Moreno, R. (2014). A heuristic method to design autonomous village electrification projects with renewable energies. Energy 73, 96-109.

HOMER Pro - Modeling

	Capacity		Cost (HOMER)		Cost (Real HOMER)	
PV Array	7368	W	28084	USD	30060	USD
Batteries	44444	Wh	10080	USD	11391	USD
Inverter	2666	W	466	USD	647,5	USD
Cables	--	--	--	--	7239	USD
Charge Controller	--	--	--	--	10094	USD
Total HOMER			38630 USD		Total real HOMER	59431 USD
					Total Algorithm	61510 USD
